SECRET

INTRODUCTION

1. Format

The Programme of Research and Development for the current year, 1954/55, like that for 1953/54, has four main divisions, each covering the work of a Superintendent's Branch:-

1. Propellant Research I: 'Development' and processing of all types of solid rocket propellants; analysis and testing; materials.
2. Propellant Research II: physico-chemical research on many aspects of combustion; rheological research; sensitiveness of explosives.
3. Explosives and Intermediates: organic chemical research; laboratory investigation of new processes; initiators.
4. Chemical Engineering: pilot plant operation and applied research.

The somewhat stereotyped pattern of subject-titles and code numbers in the Programme is taken from the 'Progressing and Planning' scheme which it is bound to follow. Thus, the main fields of current activity are summarised under one or more of five 'P and P' headings; namely, Dated Projects (a Project being a specified Service demand), Undated Projects, Post-Design Services (i.e. modifications and improvements in existing Service stores), Basic and Applied Research and Development, and Design and Development of Testing or Laboratory Equipment. Wherever possible, work of the types indicated by the last two headings is included under one of the other three against the appropriate Projects.

All items in this Programme will be worked upon continuously or intermittently during the year April 1954 to March 1955. A cross reference (marked +) is given where a particular item and code number is shared between two or more Branches. Inactive items are shown separately on the lists of deferred subjects. Items completed during 1953/54 are tabulated at the end of each Superintendent's programme, together with those deferred or abandoned.

2. Priorities

Inevitably, a very large proportion of the items on E.R.D.E.'s Programme is of the undated kind. Relatively few can be linked exclusively, or without some ambiguity, to specific Service Projects. Various reasons for this state of affairs were illustrated and discussed at some length in the Introduction to the 1953/54 Programme, so they will not be repeated here. Many R. & D. items, though not endowed with a Service priority-rating, stem from the declared policies of Controller of Munitions or P.D.S.R.(D), or of Committees such as E.D.P.C. whose Chairman is C.M. An asterisk (*) in the second Priority column indicates that the item so marked is regarded by D.M.X.R.D. and C.S./E.R.D.E. as being of particular importance, though carrying no Service or Ministry priority rating, and due to receive the maximum amount of attention within the Establishment's resources.

3. Trends

Development and research during the past year in the propellant Branches S.P.R.I. and S.P.R.II. have revealed many subtle aspects of 'plateau' and 'mesa' phenomena underlying the pressure-independence and temperature-independence of rate-of-burning of the new rocket cordites. In this connection the incorporation of lead compounds in cordite raises many problems, as yet not completely solved, bearing upon the control of manufacture and the reproducibility and

/stability

this has been reckoned with in forward thinking at E.R.D.E. Whether more or less of the Establishment's effort will actually be required in this field over the next couple of years depends very largely on Ministry policy which will determine whether any of the new processes or parts of processes, are to be utilised in the R.O.F.s. In any event, it will be E.R.D.E.'s endeavour to ensure that the 'blue prints' of pigeonholed processes are as complete as possible. An exercise to this end (probably!) has been undertaken, jointly with D.O.F.(X) on the Roberts process, and we are working towards a similar one on Chard's ('lime-cyanamide'). During the current year, at least, there can be little or no diminution of activity; but it will tend to become more narrowly focussed and allied with D.O.F.(X).

With some difficulty a little more effort is being found for problems connected with the use of High Explosives, and the manufacture of R.D.X. and T.N.T. Joint development programmes with D.O.F.(X) are increasing in number.

The projects concerned with mobile units for liquid oxygen manufacture in the field take the form of extra mural contracts with firms. Their priority ratings have lately been reduced.

The proportion of the Establishment's whole effort devoted to G.W. applications for the three Services has tended to increase throughout 1953/54, reaching a figure of nearly 47% during the last quarter, compared with an average of 40% for 1952/53.

4. Staffing

The total strength deployed on the Research Programme on April 1st, 1954, was as follows; corresponding figures on this date last year are given in parenthesis.

D.C.S.O.	1	(1)
S.P.S.O.	5	(6)
Scientific Officers (all other categories)	51	(52)
Experimental Officers (all categories)	88	(85)
Engineers	4	(4)
Assistants (Scientific), all categories	61	(51)

These figures do not include I.S.R.G. or D.M.X.R.D.'s Materials Group whose work does not appear in this Programme.

No attempt has been made to indicate the staffing of individual research and development items, or even the main groups of items. The position is somewhat fluid, and to try to represent it in advance over the course of a year could be very misleading. Moreover, for most of the separate items fractional portions of a person's time are involved. Of course, the number of items listed under a given subject-title provides no clue whatever to the number of staff engaged. An assumption which can be made with certainty is that it is small.

Deployment of staff (S.O. and E.O. categories and Engineers) in the various fields of work can be approximately represented as:-

	2
Ammunition	11
Initiators	5
G.W. Propellants (direct effort)	30
Other Propellants	17
Miscellaneous Service Equipments	4
Basic and Applied Research and Development	33

1. Format

The Programme of Research like that for 1953/54, has Superintendent's Branch:-

1. Propellant Research of solid rocket
2. Propellant Research of combustion
3. Explosives and laboratory in
4. Chemical Engi

The somewhat stereotyped Programme is taken from to follow. Thus, the or more of five 'P' and specified Service deman- cations and improvement and Development, and D. Wherever possible, work included under one of

All items in this during the year April where a particular item inactive items are sh- completed during 1953/54 Programme, together with

2. Priorities

Inevitably, a v- of the undated kind. ambiguity, to specifi- affairs were illustr- 1953/54 Programme, though not endowed of Controller of Mu- Chairman is C.M. the item so marked particular importan- and due to receive resources.

3. Trends

Development S.P.R.I. and S.P.I. phenomena underly rate-of-burning o- tion of lead comp- solved, bearing t-

SECRET

stability of ballistics. Attempts are being made to meet the demands for burning 'platonised' compositions in both the medium and high ranges of calorimetric value.

The press-extrusion of large-diameter rocket charges, and of segments of even larger charges, ought to receive more attention at E.R.D.E. than is possible in present circumstances with the small staff available. The situation will be aggravated by the slowness with which the provision of the new cordite development facilities on South Site (Project III) is progressing. They will not be ready before the middle of 1956.

Plastic propellant has become a serious contender for the re-specified 2-inch Aircraft Rocket (unguided); other experimental plastic compositions are under development and test for G.W. 'sustainer' motors.

Difficulties encountered here, and elsewhere, in the use of ammonium nitrate in Composite types of propellant is forcing our work in the direction of basic studies of the pure salt and in association with other salts and matrix materials.

Whilst Cast Double-Base is being investigated with the full effort of the small team engaged upon it, the priority accorded is tending to diminish by reason of the incessant demands from R.A.E./R.P.D. (Westcott) and A.D.E. for experimental propellants of other types. E.R.D.E. has been asked by A.D.E. to look into the development of propellants suitable to the 'gun-assisted rocket' and similar boosted missiles. Unusual physical quantities are called for and special test-methods will have to be devised.

The intention to set up a 'ball powder' plant at R.O.F., Bishopton for the manufacture of small-arms powders will necessitate greater effort by E.R.D.E. in support. This should not be underestimated.

The physico-chemical study of combustion processes in various types of solid systems will be continued. Faint outlines of some useful generalisations are emerging.

The tempo and range of rheological studies have had to be stepped up, and are expected to increase further in view of the stringent requirements of new propellant applications and the advent to Waltham Abbey of the E.R.D.E. Materials Section concerned with ammunition problems (formerly located at Woolwich), and of D.M.X.R.D's Materials Group.

The investment in spectroscopic equipment, especially the infra-red recording spectrometers, made two or three years ago is now beginning to pay dividends in the analytical field; especially in regard to the estimation of minor propellant ingredients, the examination of polymeric materials, and the study of reactions in flames.

Progress is being made, and will continue, in linking combustion kinetics with initiation and build up of detonation in liquid explosives, and in the interpretation of 'sensitiveness'.

Picrite manufacture which, in various aspects, still engages the attention of a substantial proportion of the staff of the S.E.I. and S.C.E. Branches, is tending more and more towards the 'lime-cyanamide' and 'direct fusion' route. In spite of unremitting effort no solution to the problem of the high cost of production of diethyl sulphate is in sight and this weighs against the prospects of the Roberts process without diminishing the desirability of exploring its chemical engineering aspects on a scale larger than can readily be undertaken at Waltham Abbey. From the R & D standpoint, the picrite programme initiated immediately after World War II has certainly passed the peak of activity, and

SECRET

In terms of work for the individual Services it is roughly:-

<u>Army</u>	<u>Navy</u>	<u>Air</u>
32%	29%	39%

These latter percentages could be rather misleading. The Air figure and that of Navy (29%) appear high because of the unavoidably arbitrary manner in which the large total G.W. effort and a big slice of 'general research' is to be allocated between all three Services. Apart from G.W. propellants, E.R.D.E.'s contribution to Navy's requirements is small.

A formal Research Programme cannot adequately bring out the time-consuming consultative and advisory services performed by members of the Establishment on behalf of industrial firms, other Establishments, Ordnance Factories, foreign visitors, and so on, both directly and through committees. A considerable amount of testing, mostly of a routine character, also falls to E.R.D.E. as a result of these contacts; this is referred to in the Programme under appropriate code numbers.
