DESCRIPTION

SKUA ROCKET SYSTEM

DRAWING No. 1514

BRISTOL AEROJET LIMITED, BANWELL, SOMERSET. U

S T U V AMDO SIZE 10

THE SKUA ROCKET SYSTEM was developed in the middle-1960s at Bristol Aerojet Ltd. of Banwell, Somerset, United Kingdom. The series was designed to obtain meteorological readings in the upper atmosphere and the prototypes were possessed of a 70,000m.(200,000') altitude capability. Operational firings were timed to coincide with the International Quiet Sun Year (IQSY) programme, from the South Uist island launch site.

The prototypes were boosted from truck-borne tubes utilising a discarding sabot to centralise the projectile in the launcher and cut down launch dispersion. Throughout the late 1960s and early 1970s the Skua Rocket System proved a great success with over 500 firings being recorded.

The model depicted is a SKUA 2 and represents an average example of the marque and does not duplicate a specific prototype.

Enclosed within this pack are the following:-

- Dimensioned drawings of the full-sized Skua 2 taken from *Aeromodeller* magazine, July 1984. These are approved by BAJ (the company Bristol Aerojet Ltd. has become).
- Simple workshop drawing of the model.
- Colour photographs and xerographic prints of full-size Skua 2 prototypes stored at the *London Science Museum & University College London.*
- Scale ruler applicable to model @ 1:3.0769 scale.

Issued August 1990

low dispersion. The exceptional economy of this type of sounding rocket system is due to the use of a simple case bonded, end burning, solid propellant charge and a recoverable boost system. The motors are supplied by the Rocket Propulsion Establishment, and possess a very high performance for their size. The recoverable boost lands very close to the launcher. A non-recoverable boost can be supplied for firings from ships.

SKUA and PETREL rockets both use the same launcher. This is basically a 53 cm. diameter tube, 10 m. long which can either be mounted on a truck (the mobile launcher,) on a turntable or a simple crane (pivot launcher).

PETREL and SKUA can be supplied with standard forward ejecting or clam shell noses.

STORAGE LIFE

The storage life of the main motors is 9 months, this applies to both SKUA and the PETREL. The storage life of the boost motors is 5 years and this applies also to all the igniter units. The storage life of the payload ejection motor for the SKUA is also 5 years.
